

The bound clears the standard. Nothing is lost by the simpler model, and a vocabulary that could not say this would be useless.

Art. 3(3b): a below-quantification result whose limit exceeds the standard shall not be considered. The two-valued answer flips with the substitution constant, and the record does not say which was used.

Art. 4(1) permits 50 % expanded uncertainty at the level of the standard, so this interval straddles it. A method meeting only the legal minimum cannot decide either way.
